

Plantronics APV-63 EHS setup

Savi/CS500

Looking at your EHS cable, the larger of the plugs (combination of an RJ and pin connector) will plug into the base of your headset.

The Other end of the cable will plug into the headset jack on the back of your telephone.

The ring detector – the cable with the round disk on the end – will need to be stuck down to your phone, directly on top of the phones speaker (where the ring sound comes from) This is the part that picks up when your phone is ringing and sends the beeping signal to your headset.

Tried everything and still not working?
